

FUSELAGE ASSEMBLY

STEP 1

Important—Be sure to read introductory note on other side of plan before starting assembly of this model. Remove any creases in paper down to building board, and cover with Saran wrap to prevent frame from sticking to plan. Printed parts may all be cut out before construction is started. Using wire provided, bend 16 new ceiling-mounted brackets. Bend 7 old ceiling-mounted brackets. Solid black lines show recommended location. Solid black dots show suggested locations. Fold 18 1/2 x 10 1/2 square strips carefully to length, pin ends in place. Add parts #25 and #26. Allow slide frame to dry before removing from boards, then turn around another identical side frame.

STEP 2

Assemble fuselage sides by cementing them together at rear. Be certain ends are perfectly flush with each other. Then cement bulkhead #27 to fuselage sides as shown. Allow to dry. Then cut cross-members to length shown in callouts on top view. Cement them in place on fuselage with the corresponding bulkhead #30 to #36 on top. Land on rear of bulkhead #28/29 installed as shown. Cut floor from front to rear, holding sides together with tape where necessary. Check assembly with a square. Top view to be certain fuselage is aligned properly. Also check from front and rear to be sure fuselage is square and not distorted. Allow to dry thoroughly.

TEP 3

Slit top cover #37 with warm water to aid in bending and cement it in place to top of fuselage as shown. Mold in place with tape until dry. Remove fingers 4/16" long. Install 1/16 sq. cent. stringers 1/32" apart. Install 1/16 sq. cent. stringers to notches from #33 to rear then 1/32 sq. stringers in place as shown. Free on each side. Allow to dry thoroughly. Refit fuselage and cement to prepare for issue covering. Tail #48 is cemented in place as shown on sketch and side view AFTER sealage is covered.

WING ASSEMBLY

1 dets

Cut $1/16 \times 1/8$ " trailing edge tabs to show and align pin to plan, then cement tips #51 to trailing edge tabs. Cement all ribs vertical in place in numerical order. Toppling has a single #43 in center as shown. Ribs are in same manner, however two #43's are used as shown. Leading edge lines in sketch. Cut $3/32 \times 3/4$ " square trailing edge tabs to length and cement to front of ribs and tips. Ribs that ribs remain vertical and in line with tips. Ribs that ribs remain vertical and in line with tips. Cement top of spar. Spars are now cemented to matches in top of gutter. Spars are now cemented in place except at inner rib #44, which must be free to move when installing dihedral in next step. Spars are cranked at tip ribs to angle $1/2$ " in 12" with thin tip. Cement gussets $1/8 \times 1/8 \times 1/8$ " in place. Cement ribs #45 to #49 to dry thoroughly.

TEP 2

Using your sharp razor blade, cut completely across the leading and trailing edges on outside of the center section. Keeping center section in place, remove panels from flat surface in primed order. Turn outer panels back in place, raising tips 9/16". The panels are now immediately cemented in place and assembled smooth to dry THOROUGHLY. When dry, sand leading edge. Build bottom wing in same manner. Coat top of #4's over full-size plan as shown.

STRUT DETAIL

cut all struts from 1/16" x 1/8" strips using all-size patterns. Sand smooth, rounding corners. Make two of each.
